

Hospital Appointment System — Project structure

Purpose: Two-part web application: **Angular** UI + **Spring Boot** REST API. Data in a **SQLite** file. Authentication uses **JWT** with roles (Patient, Doctor, Receptionist, Admin).

Top-level layout

Path	Role
backend/	REST API (Java 17, Maven), security, JPA persistence
frontend/	Single-page app (Angular 20), calls /api
README.md	Vision: actors & future modules (appointments, doctors, ...)
docs/	This overview

Omit build caches when presenting source: `frontend/dist/` , `frontend/.angular/cache/` .

Backend (backend/)

- `pom.xml` — Spring Web, Security, Data JPA, Validation, JWT (jjwt), SQLite JDBC
- `mvnw.cmd` — Maven wrapper
- `src/main/resources/application.properties` — port 8080, SQLite `./data/hospital.db` , JWT & seeded admin
- `HospitalApiApplication.java` — Spring Boot entry point
- `domain/` — User entity, Role enum
- `repository/` — UserRepository
- `api/auth/` — register, login, /me ; DTOs; AuthService
- `api/admin/` — admin-only user CRUD under /api/admin/users
- `api/` — health check, global exception handler
- `security/` — JWT filter & service, UserPrincipal , user-details loading
- `config/` — security chain, CORS, data seed, SQLite folder helper
- `src/test/` — Boot tests; in-memory SQLite profile

Runtime DB file: `backend/data/hospital.db` when the API is started from `backend/` .

Frontend (frontend/)

- `package.json` / `angular.json` — Angular 20; dev proxy to port 8080 for /api
- `proxy.conf.json` — forwards /api to Spring
- `src/app/app.config.ts` — router, HTTP client, auth interceptor
- `src/app/app.routes.ts` — login, register, dashboard, users (admin)
- `src/app/auth/` — login & register pages, AuthService , guards, models
- `src/app/dashboard/` — post-login home
- `src/app/users/` — admin user management + UsersService

Dev request path

Browser → localhost:4200 (Angular) → relative /api/... → **proxy** → localhost:8080 (Spring). After login, requests include Authorization: Bearer

README vs. code today

In code: auth, JWT, roles, admin user directory, dashboard shell.

In README only (future): appointments, doctors, medical records, notifications, analytics.

Short structure guide for presentations — not a full specification.
